LOOM WEAVING

GIFT 1

Loom Weaving with Seed Beads: The Bonus Technique

A beginner-friendly guide to making flat, patterned bead bracelets on a loom: from setting up the warp to finishing, fixing, and selling

Welcome to your bonus technique. If you have ever admired a bracelet with a crisp geometric pattern, a row of tiny hearts or a name spelled out in beads, there is a good chance it was made on a loom. Loom weaving is one of the friendliest ways to work with seed beads, and it fits perfectly beside the stitches you are learning in the Tiny Bead Profit Method.

This guide takes you from your first look at a loom to a finished, clasped bracelet. You will learn what to buy, how to set up the warp, how to read a chart, how to weave each row evenly, how to change colors, how to finish the ends, and how to fix mistakes without panic. You will also find ten beginner-friendly projects, a practical chapter on pricing and selling, and a comparison with peyote and square stitch.

Go at your own pace. Read one chapter, try the practice task, and come back. Nobody weaves a perfect bracelet on the first try, and you do not need to. A small, slightly imperfect swatch is the best teacher there is.

1. What a Bead Loom Is and Why It Is Great for Bracelets

A bead loom is a simple frame that holds a set of parallel threads under tension while you weave beads between them. The parallel threads are called the warp. The thread you pass back and forth through the beads is called the weft. That is the whole idea. Because the frame keeps everything tight and in line, you do not have to hold a tiny piece of beadwork in your fingers and keep the tension in your head. The loom holds it for you.

This is why loom weaving is such a friendly technique for beginners, and why it earns its place as the bonus technique in your Tiny Bead Profit Method. Once you can load a loom, you can make a flat, even, patterned strip of beadwork in an evening. A strip is exactly what a bracelet is.

> **IN PLAIN WORDS**
> Warp = the long threads fixed to the loom. Weft = the working thread that carries the beads. Row = one line of beads across the warp. Column = one bead position, counted across the width of the piece.

Here is what makes a loom so good for bracelets in particular:

- Speed. A row of ten beads goes on in one pass of the needle and one pass back, instead of ten separate stitches.
- Even tension. The frame keeps the rows straight, so the finished strip lies flat and looks tidy.
- Pictures and patterns are easy. Every bead sits in a grid, so a chart translates directly to the piece. Letters, hearts, stripes, diamonds and geometric motifs are all natural on a loom.
- Low frustration. If you lose your place, the previous rows are still locked in place on the frame, so it is easy to see where you are.
- A neat, professional look. Loomed bracelets have a smooth, fabric-like surface that people often assume was much harder to make.

There are also honest limits. A loom makes flat, rectangular pieces. Curves, tubes and sculpted shapes are better suited to peyote, brick or herringbone stitch. And a loom needs setup time: you must string the warp before the first bead goes on. We will cover that carefully so that it becomes a ten-minute habit, not a chore.

Everything in this guide uses the same beads you already meet in the main method: Miyuki Delica 11/0 cylinder beads. Their flat, uniform shape fits together almost like tiles, and that is why they are the favorite for loom work. Round 11/0 seed beads work too, but the result is a little bumpier and rows can look slightly wavy. Toho cylinder beads are a fine alternative; just keep to one brand within a single piece.

2. Choosing a Loom, Tools, Beads, and Thread

You will see many looms for sale, from a few dollars to well over a hundred. For bracelets, you do not need an expensive one. You need a loom that is the right width for your project and gives you steady tension. Here are the common types.

Loom type	Typical price range (examples, check current prices)	Best for	Watch out for
Basic metal frame with spring coils or grooves	Low, often under about $25	First bracelets, cuffs up to about 2 inches wide	Short working length; you may need to advance the weaving partway through longer bracelets
Wooden frame with notched ends	Low to moderate	Simple projects, a pleasant feel for hobbyists	Warp spacing is set by the notches, so check that it suits Delica 11/0
Adjustable-bar loom (rollers or movable bars)	Moderate	Long bracelets, belts, bookmarks, larger pieces	More moving parts; takes a few minutes to learn how to adjust
Table-style or standing loom	Moderate to high	Producing many pieces, wide work	Takes space; more than a beginner needs
Homemade card or cardboard loom	Almost free	Testing whether you enjoy the technique	Less precise; not for pieces you plan to sell

For your first loom, a basic metal loom with a coiled-spring or grooved bar at each end is a perfectly good choice. It is inexpensive, light and portable. If you already know you want longer bracelets with fewer interruptions, an adjustable loom is worth the extra money, because you can turn the bars to roll finished weaving out of the way and keep working.

> **HOW TO CHOOSE QUICKLY**
>
> Ask two questions. First, how wide will my pieces be? Check that the loom comes with a usable width in beads for your beads: most bracelet looms take between about 6 and 20 columns of Delica 11/0. Second, how long will my pieces be? If you want 7 inches or more, choose a loom with an adjustable or long working area.

Look for these features no matter the type:

- Spring coils, grooves or combs at both ends that hold each warp thread in its own space.
- Spacing that matches your bead size. Many looms are designed for 11/0 beads, but always read the product description.
- Tension control: a way to tighten the warp, usually a screw, a roller or a lever.
- A sturdy frame that does not twist when you pull the warp tight.
- Enough open length between the bars for a full row of beads and your needle.

Because brands and prices change, check the product listing for its measurements before ordering. Beginner kits often include thread, needles and a small bead mix, which is useful but not essential. We list suppliers in your main package; for looms, typical places to compare are Amazon, Etsy shops and bead retailers such as Beadaholique, Fire Mountain Gems and Artbeads. Prices and

2. Choosing a Loom, Tools, Beads, and Thread (continued)

- Your loom.
- Miyuki Delica 11/0 cylinder beads in two to four colors. Cylinder beads are best for loom work because their uniform size keeps rows straight.
- Beading thread for the weft and warp. Nylon beading thread (for example size D) or a braided fused line in 6 to 8 lb weight both work. The fused line is stronger and does not stretch, which is good for the warp.
- Beading needles, size 11, 12 or 13. A longer needle is helpful on a loom because it passes through a whole row at once. Keep a few spares; fine needles bend and break.
- Small sharp scissors or thread snips.
- A bead tray or a shallow dish with a non-slip mat, so beads do not roll away.
- A ruler or a bead gauge, a pencil and a printed chart.
- Good light and, if you wish, a magnifier lamp or reading glasses.
- Clear nail polish or a drop of fabric glue, optional, to secure knots.

Choosing thread for each job. You do not have to use the same thread for the warp and the weft, and many people do not.

Job	Good choices	Why
Warp threads	Fused or braided line, 6 to 8 lb, or strong nylon beading thread	Must stay taut and not stretch; a stretchy warp makes a floppy bracelet
Weft thread	Nylon beading thread, size D, or thin braided line	Passes through each bead twice, so it must be thin enough to fit
Bead color check	A pale thread for light beads, dark thread for dark beads	Thread can show through between beads; match it to the dominant color

> **THREAD AND BEAD HOLE SIZE**
> The weft passes through every bead twice. Delica 11/0 beads have fairly large holes, so thin thread works well. If your needle will not slide through, switch to a thinner needle or lighter thread rather than force it.

3. Setting Up the Warp

This is the step that decides how pleasant everything else will be. Take your time, because a well-set warp makes weaving almost automatic.

> **THE GOLDEN RULE**
>
> The number of warp threads is always the number of bead columns plus 1. A bracelet 10 beads wide needs 11 warp threads. A bracelet 12 beads wide needs 13. This is because each bead sits between two warp threads, with one thread at each outer edge.

Step by step:

- Decide the width and the length. Example: 10 columns wide, about 6.5 inches long for the beaded part.
- Cut your warp thread. Measure the total length of the loom between the two end bars and add the length you want to weave plus about 12 inches for knotting, waste and finishing. A common beginner mistake is cutting it too short. Extra is cheap, and you will use the tail to attach the clasp.
- Tie one end of the thread to the first bar or coil. Use a firm overhand knot, then a second knot on top.
- Run the thread along the loom, over the first end coil, along the length, and around the opposite end coil in the matching slot. Return along the next slot. Continue until you have 11 threads for a 10-column piece.
- Keep the threads parallel. Each thread should sit in its own groove or between its own coils. No crossings, no twisting.
- Pull gently to take up slack, then tie off the last thread to the bar with a double knot.
- Use the tension control to tighten until the warp feels like guitar strings: firm but not so tight that it hurts the loom or snaps.

Spacing matters. The distance between warp threads should be about the width of one bead. If the threads are too close, the beads will not fit and will bunch up and stand up. If they are too wide, you will see gaps and the rows will look loose. Many looms have a coil spacing designed for 11/0 beads. If yours is not, you may need to space the threads by hand using a ruler. A quick check: lay a Delica bead between two warp threads. It should sit snugly with a very slight give.

Bead columns wide	Warp threads needed	Approximate width of Delica 11/0 piece (check by weaving a swatch)
6	7	about 3/8 inch (10 mm)
8	9	about 1/2 inch (13 mm)
10	11	about 5/8 inch (16 mm)
12	13	about 3/4 inch (19 mm)
16	17	about 1 inch (25 mm)
20	21	about 1 1/4 inches (32 mm)

These widths are estimates. Beads vary slightly from batch to batch, so weave a small test strip

3. Setting Up the Warp (continued)

YOUR SAFETY MARGIN

After weaving, you will cut the warp threads off the loom, leaving long tails. Those tails become the ends of your bracelet. Without a generous length, you will not be able to weave them in or attach a clasp. When in doubt, leave more.

Practice task: warp a practice loom

Set up a loom with 7 warp threads (6 columns) and just 2 inches of work space. Do not add any beads yet. Look from the side to make sure all the threads are level, and press each one to check tension. Take it apart and do it again. The second time will be much faster.

4. Reading a Loom Chart

A loom chart is a grid of colored squares. Each square stands for one bead. The chart is the picture of what your finished bracelet will look like when you look straight down at it.

To read it, you need only three ideas.

- Each column of squares in the chart matches a bead column between two warp threads.
- Each horizontal line of squares is one row of weaving. You weave one whole row at a time.
- The chart is read from the bottom row up if the chart is meant to be woven from the bottom, but many charts mark row 1 explicitly. Always look for numbers or arrows beside the chart.

> **SYMBOLS AND COLORS**
>
> A good chart has a key. It shows each color or symbol with the bead color it stands for, such as Delica number or a simple name like cream, teal, gold. If a chart has no key, create your own and write down the color for each symbol before you start.

Counting. Chart size is written as columns by rows. For example 10 x 80 means 10 beads across and 80 rows long. A chart this size makes a bracelet about 5 inches of beadwork, because Delica 11/0 rows come out at roughly 16 rows per inch (check by weaving a short swatch). Add the clasp and you reach about 6 to 7 inches.

Repeating patterns. Many bracelet designs repeat a small block of rows over and over. If a chart shows only one repeat, it will tell you to repeat it until the bracelet is long enough. A good habit: count the rows in one repeat and write that number at the top of the page.

Chart feature	What it means	What to do
Numbers along the side	Row numbers	Check them off as you finish each row
Numbers along the top	Column numbers	Count them to make sure your chart matches the warp
Bold line or box	One repeat of the pattern	Weave the repeat as many times as needed
Blank squares	Background color not yet filled in	Check the key; usually the background color
Half squares or shaded squares	Sometimes a different bead type	Read the key

Mark your place. Use a ruler or a sticky note under the row you are working on, or a pencil with light diagonal marks. Many weavers print a second copy and cross off finished rows with a colored pencil.

5. Weaving Row by Row, Changing Colors, and Tracking Rows

Now the part you came for. Everything so far was preparation. Once the warp is ready, weaving a row is a short, repeatable routine that you will soon do without thinking.

> THE RHYTHM OF ONE ROW
>
> 1. Pick up the beads for the row. 2. Pass the needle under the warp threads. 3. Push the beads up between the warp threads. 4. Pass the needle back through the beads, going over the warp.

Detailed steps:

- Cut about 1.5 yards (about 1.4 m) of weft thread and thread your needle. Tie the end of the weft to the outer warp thread near the starting end, with a firm knot, leaving a tail of 4 to 6 inches.
- Following the first row of your chart, pick up one bead for each column. For a 10-column piece, pick up 10 beads in the correct colors, in the order shown on the chart, left to right.
- Slide the beads down the weft thread. Take the needle and the beads underneath the warp threads, from right to left or left to right.
- With your finger, push each bead up so it sits between two warp threads. You should have one warp thread between each pair of beads, plus one on the outside of each edge.
- Now bring the needle back, this time over the top of the warp threads, and pass it through all the beads again in the same direction. Here is the key: the needle passes through the beads above the warp, so the warp is trapped between the two passes of weft thread.
- Pull the thread snug, not tight. The beads should be in a straight line, side by side, with the warp hidden between them.
- Repeat for the next row, picking up the beads in the order of the next chart row.

Why the return pass matters. The first pass places the beads under the warp, but only the second pass locks them in. If you skip the second pass, the beads may pop out of line when you pull the thread. Do not skip it.

A tip for the direction of travel. Most people weave right to left, then left to right, alternating each row. The chart is simply read in the same order. If you are using a simple, symmetrical design, direction matters less. For anything with letters or asymmetry, mark the direction on your chart.

Keeping rows even. Uneven rows are the number one beginner worry. They come from these causes:

Problem	Likely cause	Fix
Row bows upward	Weft pulled too tight	Loosen the pull; thread should only take up slack
Row has gaps	Weft too loose, or beads not fully pushed up	Push beads up firmly before returning, snug the thread
Edges wavy	Edge warp threads loose	Retighten the whole warp, and keep an even pull at the end of each row

5. Weaving Row by Row, Changing Colors, and Tracking Rows (continued)

Practice task: weave a swatch

Using the 6-column loom from the previous practice task, weave 15 rows in one color, then 15 rows in a second color. Take it off the loom mentally and look at it. Are the edges straight? Do the rows lie flat? Measure with a ruler to find your own number of rows per inch. Write it down. This number will help you plan every future bracelet.

On a loom, changing colors does not mean changing thread. It simply means picking up a different color bead when the chart says to. This is the great advantage of loom work: every bead is placed on purpose, row by row, so any pattern is possible.

How to pick up colors accurately:

- Read the whole row from the chart before you pick up any beads. Say it quietly: for example, three cream, four teal, three cream.
- Lay the beads out in order on your tray or a bead mat, in the sequence of the row, before you thread them.
-
- Count the beads on the needle. The count must equal the number of columns exactly.
- Check the beads against the chart one more time before you pass the needle under the warp.

> **COUNT TWICE, WEAVE ONCE**
> Mistakes are cheapest to fix before the return pass. Make it your rule to count the beads on the needle every single row. It takes two seconds and prevents most unraveling.

Keeping track of the row number. When you have a pattern with 80 rows, it is easy to lose your place. Use one of these methods:

Method	How it works	Best for
Pencil ticks	Make a small mark beside each row as you finish it	Everyone, always works
Sticky note or ruler	Slide it under the current row on the chart	Large or complex charts
Row counter app or click counter	Tap once per row	People who often get interrupted
Safety pin marker	Clip a pin in the weft every 10 rows	Counting the actual woven rows
Photograph	Take a photo of the work at stopping points	Pausing a project for days

6. Finishing: Weaving in Ends, Clasps, End Caps, and Ribbon Ends

Finishing separates a handmade-looking piece from a professional one. Done well, it is also what makes a bracelet last. Spend as much care here as you did in weaving.

Step 1: Weave in the weft tails. Take your weft tail (the beginning knot and the end of the thread). Thread it on a needle and weave it back through several rows of beads, changing direction at least twice, so the thread cannot slide out. Take it along the edge of the bracelet, zigzag through a few more beads, and pull snug. Trim the excess very close with sharp snips. Do not cut the warp yet.

Step 2: Secure the warp threads. The warp threads are still attached to the loom. You will cut them, but you must secure them first. Here are the common methods.

Finish	How it works	Good for	Notes
Weave in warp ends	Cut warp off loom leaving long tails, thread each on a needle and weave back into the beads in a zigzag, then trim	Clean, sewn-in edges; bracelets fastened with sewn-on clasps	Slow, because every thread must go back through the beads; the neatest result
Fold-over end caps (crimp ends)	Gather the warp threads into a small bundle, add a drop of glue, and squeeze a clamshell or fold-over crimp end over them	Quick, neat finish	Use a good glue; glue the threads flat; crimp firmly
Ribbon ends (flat clamp ends)	Flat metal clamp that grips the bracelet's width, usually with a small ring to attach a clasp	Wider bracelets of 10 to 20 columns	Choose a size to match your bracelet's width; check the product listing
Sewn-on clasp	Stitch the clasp rings directly onto the end rows with the leftover thread	Light bracelets; delicate look	Add a reinforcing loop of thread for strength
Fringe or ties	Leave the warp ends long, bead them, and tie them as a closure	Boho style, adjustable wraps	A lovely option without any metal findings

Step 3: Add a clasp. Common choices are lobster clasps, toggle clasps and magnetic clasps. Lobster clasps are easy to open and secure for most customers, while toggles are decorative and simple to put on with one hand. Magnetic clasps are popular for people with arthritis or limited dexterity, but check that the magnets are strong enough for the weight, and note that people with pacemakers or similar devices are often advised to avoid magnets. Check the instructions from the manufacturer. A jump ring connects the clasp to the end cap or ribbon end. Use two pairs of pliers to open the jump ring sideways (never pull it apart), thread it through, and close it fully, with the ends meeting flush.

> **CHECK STRENGTH**
>
> Before a bracelet goes on a wrist, hold the finished piece at both ends and give it a gentle but firm tug. Check that the clasp, ring and end cap hold. Any slip at this stage becomes a failure on the wrist.

Step 4: Final look. Check both edges for any loose beads or poking thread. Run a finger along each side. Brush off dust, and flatten the piece. If you want a soft fall, bend the bracelet gently round a rolled towel for a minute.

7. Fixing Mistakes

Every weaver, however experienced, makes mistakes. The difference is that experienced weavers have a plan. Loom work is easy to repair if you catch the error early, and it is also easy to restart because rows are fast.

Mistake	How to spot it	Fix
Wrong bead color in the current row	You notice before the return pass	Slide the beads off the needle, swap the wrong bead, and rethread the row
Wrong bead color several rows back	Pattern looks off	If the error is small and invisible, it can be left. If it is obvious, unpick the rows back to the error
Missing or extra bead in a row	Row is too short, or beads bunch up	Count beads, remove or add, redo the row
Weft thread skipped under a warp	A bead sits over a warp thread, or the row gaps	Unpick the row and redo it
Weft broke	The thread snaps while weaving	Tie on a new piece and weave back through two rows
Warp thread broke	The loom feels slack on one side	Re-tie the warp, or weave the broken thread into the piece; replace it if early
Cracked bead	Visible chip or crack	Unpick the row and replace the bead

> THE SIMPLEST WAY TO FIX A ROW
>
> Unpick it. Pull the needle out of the row, slide the beads off the weft, and start the row again. A single row takes about a minute. It is almost never worth leaving a visible error in a piece you hope to sell or give.

Unpicking rows. To undo a row, remove the weft thread back through the beads, going slowly, so you do not damage the warp. Take the beads off the thread. If the row was locked in by the return pass, pull the needle back through the beads in the opposite direction. For several rows, work from the top row down. Never yank, because it can fray the warp.

Preventing mistakes. Most mistakes are preventable by three habits: count beads on the needle every row, mark rows on the chart, and check the work after every ten rows. Good light and a pause when you are tired will prevent more errors than any technique.

Practice task: make and repair a mistake

On a practice swatch, weave a row with one wrong bead on purpose. Then fix it three ways: before the return pass, after the return pass, and two rows later. Time yourself. You will feel far more confident when the real thing happens.

8. 10 Beginner-Friendly Loom Projects

These ten projects use only simple geometry. Sizes are given as columns by rows. With Delica 11/0 beads, roughly 16 rows make an inch, so check by weaving a swatch and adjust. Each is a good first or second project. Dimensions are approximate.

No.	Project	Size (columns x rows)	Look	Colors
1	Simple stripe cuff	8 x 100	Wide horizontal bands of alternating color	Two
2	Mini diamond bracelet	10 x 100	A repeating diamond chain down the center	Three
3	Zigzag wave band	10 x 96	Bold chevron lines that look like waves	Two to three
4	Dotted line bracelet	8 x 100	Small single beads in a contrasting color along a plain base	Two
5	Checkerboard bracelet	10 x 100	A classic two-color checkerboard	Two
6	Heart row bracelet	12 x 110	A line of small hearts repeating	Two
7	Name or initial bracelet	14 x 110	Blocky letters in a contrasting color on a plain background	Two
8	Gradient ombre band	10 x 120	Colors fade gradually from one shade to another in stripes	Four or five
9	Narrow bookmark	8 x 200	Long simple pattern with a fringe tassel at one end	Two to three
10	Wide statement cuff	20 x 100	A bold geometric pattern across a wider band	Three

Notes on the projects:

- Stripe cuff. The easiest start. Repeat 6 rows of color A, then 6 of color B. Good for practicing tension.
- Mini diamond bracelet. A diamond is symmetrical, so direction matters less. The repeat is about 10 rows.
- Zigzag wave band. Use a repeat of 8 rows: slide the line one column right each row, then back.
- Dotted line bracelet. Place a single contrasting bead on every other row to give a delicate dotted effect.
- Checkerboard bracelet. Alternate two colors in blocks of 2 by 2 beads for a neat grid.
- Heart row bracelet. Work from a small heart motif of 5 columns by 5 rows, and repeat. Keep the background plain.
- Name bracelet. Letters are about 5 columns by 7 rows each. Plan spacing between letters of one column. A name of five letters needs about 29 columns of length once spaced, so rotate the design to run along the bracelet.
- Ombre band. Choose five related shades of one color, and weave bands of 4 to 6 rows each.
- Bookmark. After weaving, leave the warp ends long and bead them into a tassel.

9. Pricing, Selling, and Choosing Between Loom, Peyote, and Square Stitch

Many people begin loom weaving as a hobby and then find that friends ask whether they can buy one. That is a pleasant surprise, but it deserves a clear head. This chapter gives you a framework for thinking about price. The numbers here are examples only, not a promise of income. Prices people list for similar pieces vary widely, and what sells depends on your design, photos, audience and effort.

Start with your costs. List everything that goes into one bracelet.

Cost item	Example amount (USD, illustrative)	Notes
Beads	$1.50 to $4	A fraction of a tube; compute by weight
Thread	$0.20 to $0.50	A length of weft and warp
Clasp and end caps	$0.75 to $3	Depends on metal and finish
Packaging	$0.50 to $2	Small box or card, tissue, label
Your time	Your choice of hourly value	A simple bracelet may take two to four hours at first, less with practice

A simple formula that many makers use: add up the cost of materials, add an amount for your time, and then add a share of your overhead such as tools, listing fees, shipping supplies and photos. That gives you your minimum price. Prices can then go up with uniqueness, design quality and demand.

> TYPICAL RANGES (EXAMPLES, NOT A PROMISE)
>
> Handmade beaded loom bracelets are listed online at a wide spread. Simple designs might be listed from around $15 to $30, while detailed or custom pieces such as name bracelets and wide cuffs may be listed from around $30 to $70 or more. These are examples of what people list for similar pieces, not a guarantee of what you will earn.

Where to sell. You have several options: friends and family, local craft fairs and holiday markets, small shops that take consignment, and online marketplaces. Etsy, for example, is a popular choice for handmade jewelry. Marketplaces charge fees, and sales tax and business registration rules vary by state and country, so check current fees and your local rules before you start. This guide cannot give legal or tax advice.

What helps a listing:

- Clear photos on a plain background, with natural light, plus one photo on a wrist for scale.
- A title that says what it is, in words a buyer would search for: for example, beaded loom bracelet, geometric, handmade.
- Honest size information, in inches and centimeters.
- A short description of the materials and how to care for the piece.

9. Pricing, Selling, and Choosing Between Loom, Peyote, and Square Stitch (continued)

Feature	Loom	Peyote stitch	Square stitch
Equipment	Loom, warp thread	Just needle and thread	Just needle and thread
Beads sit in	Neat grid, rows aligned	Offset, brick-like rows	Neat grid, like loom
Speed for flat strips	Fastest	Slower	Slower
Best for	Flat bracelets, bands, bookmarks, patterns and letters	Curves, tubes, shaped pieces, earrings, bezels	Grid patterns without a loom, small precise shapes, charts
Setup time	Longer (stringing the warp)	Almost none	Almost none
Portability	Needs the frame	Very portable	Very portable
Flexibility of the fabric	Slightly stiffer	Flexible and drapey	Slightly stiffer
Learning curve	Gentle once warped	Moderate; counting rows matters	Moderate; thread path needs care
Edges	Straight, clean	Slightly zigzag	Straight
Fixing mistakes	Unpick a row quickly	Harder; you may have to unpick several stitches	Harder, stitch by stitch
Typical size of project	Bracelets, cuffs, long bands	Earrings, pendants, tubes, rings	Charms, patterns on small scale

How to choose:

- Making a flat patterned bracelet quickly? Choose loom.
- Want something you can carry in your bag and work on a train? Choose peyote or square stitch.
- Need a shape with curves or a tube, like a bead cord or a ring? Choose peyote.
- Want grid-accurate patterns without a loom? Choose square stitch.
- Making a gift in an evening? Loom is usually quickest once the warp is set up.

> **THEY WORK TOGETHER**
>
> Many makers combine them. A loomed bracelet may have a peyote-stitch edge or a square-stitch clasp tab. Learning loom work does not replace the other stitches; it adds a fast, reliable tool to your kit.

Next steps

You now have everything you need to weave your first bracelet on a loom: the tools, the setup, the chart skills, the row-by-row routine, and a plan for fixing what goes wrong. The biggest step is simply to string your first warp and place your first row.

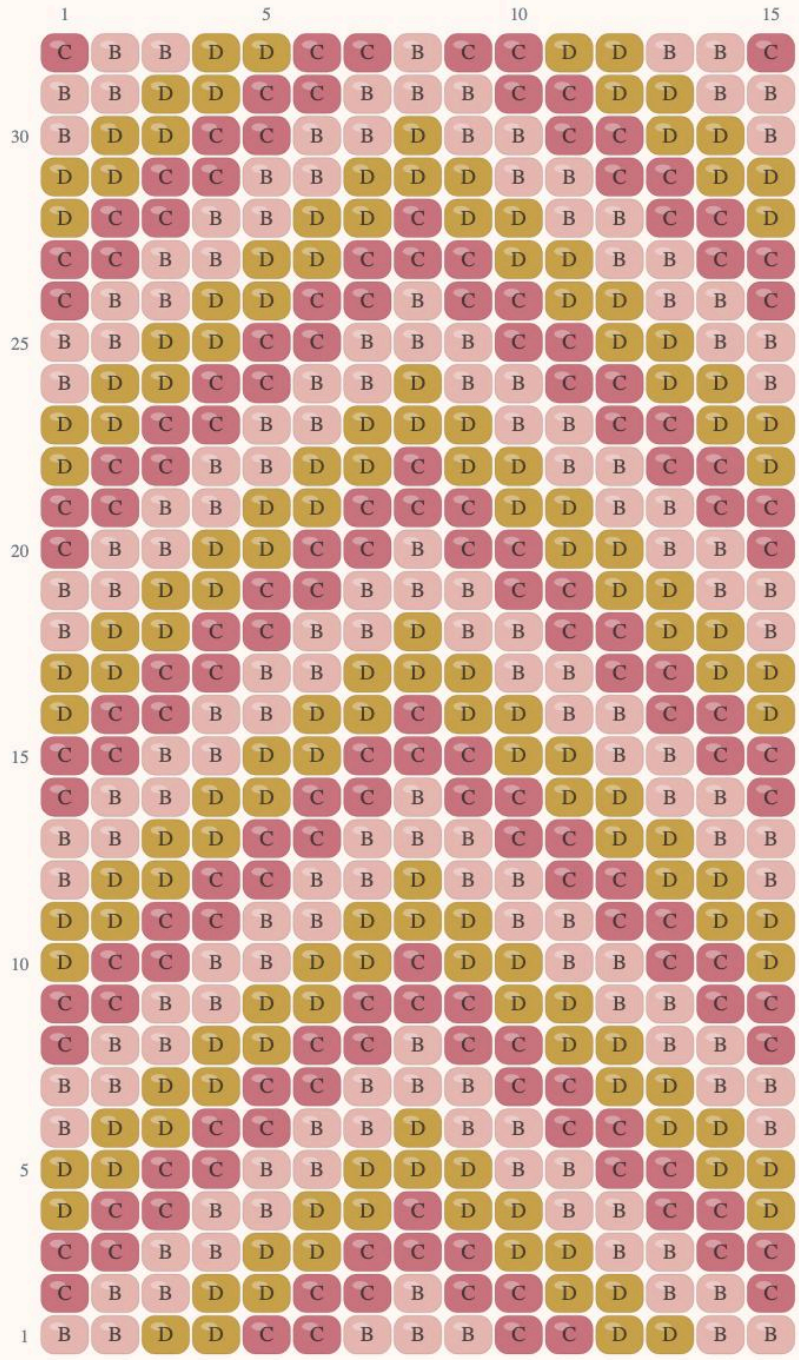

Start with a stripe or a zigzag. Make a swatch. Make a bracelet. Give one to someone you love. As your confidence grows, move on to the other projects and to the stitches in the main method. Each finished piece makes the next one easier.

Happy weaving, and enjoy every tiny bead. The Tiny Bead Studio team.

1. Blush Chevron Bracelet

Blush & Gold palette · Loom · 15 × 32 beads (one repeat)

STITCH	CHART SIZE	TIME (APPROX.)	TYPICAL LISTING RANGE
Loom	15 × 32 beads	7.3–10.5 h	$24–$48

	Color	Count
	B · Matte blush	162 beads
	C · Rose	160 beads
	D · Metallic gold	158 beads

Total: Repeat the chart 4× for a 7-in. bracelet (≈112 rows, 1680 beads).

Weave on a bead loom: row 1 at the bottom, work upward. Every row is one pass of beads.

Swap colors freely: keep the same dark/light order and the pattern holds.

RECOLOR IDEAS

Lavender Haze

Midnight Silver

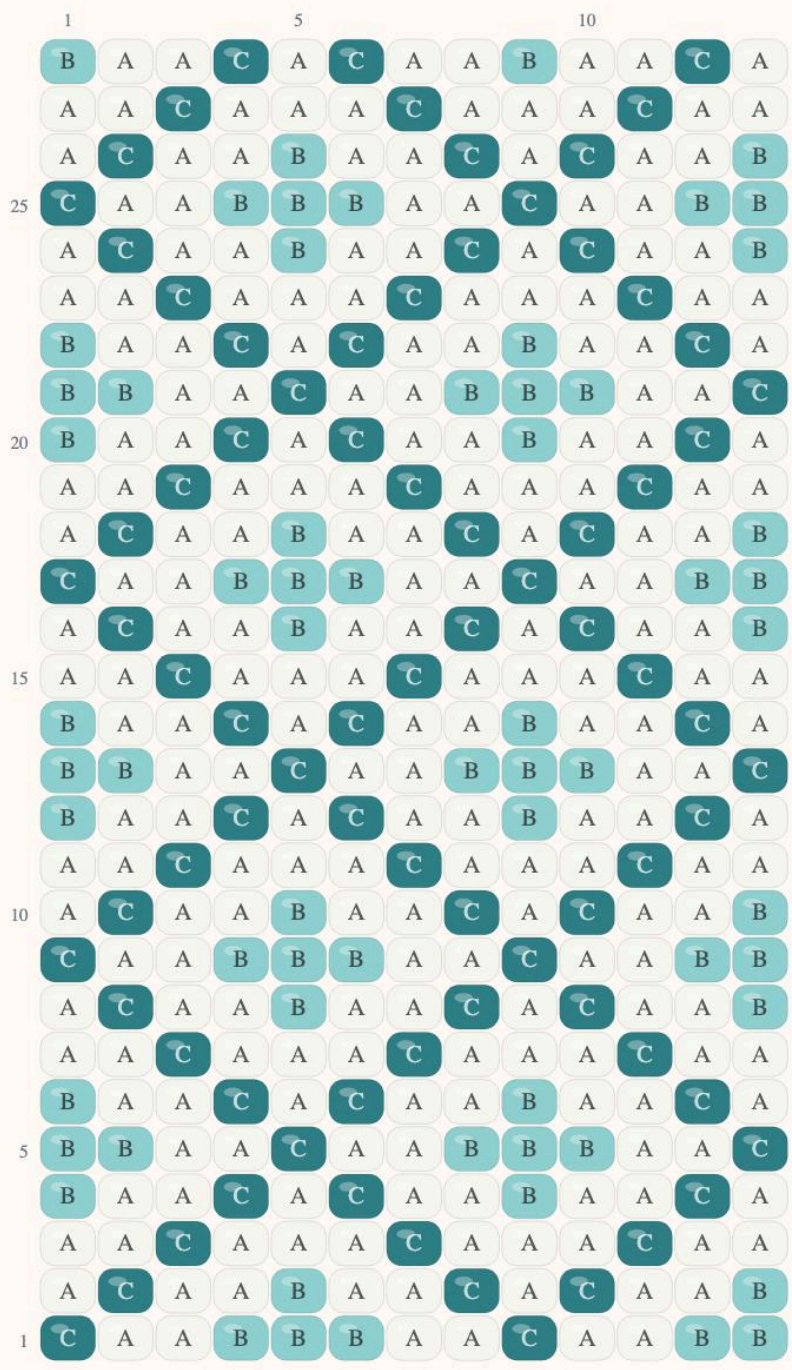

Terracotta Sand

Listing ranges are examples of what similar handmade pieces are listed for, not a promise of sales. Use the Price Calculator bonus for your own numbers.

3. Ocean Argyle Bracelet

Ocean Teal palette · Loom · 13 × 28 beads (one repeat)

STITCH	CHART SIZE	TIME (APPROX.)	TYPICAL LISTING RANGE
Loom	13 × 28 beads	6.3–9.1 h	$18–$38

Color	Count
A · White	224 beads
B · Aqua	63 beads
C · Teal	77 beads

Total: Repeat the chart 4× for a 7-in. bracelet (≈112 rows, 1456 beads).

Weave on a bead loom: row 1 at the bottom, work upward. Every row is one pass of beads.

Swap colors freely: keep the same dark/light order and the pattern holds.

RECOLOR IDEAS

Denim Daisy

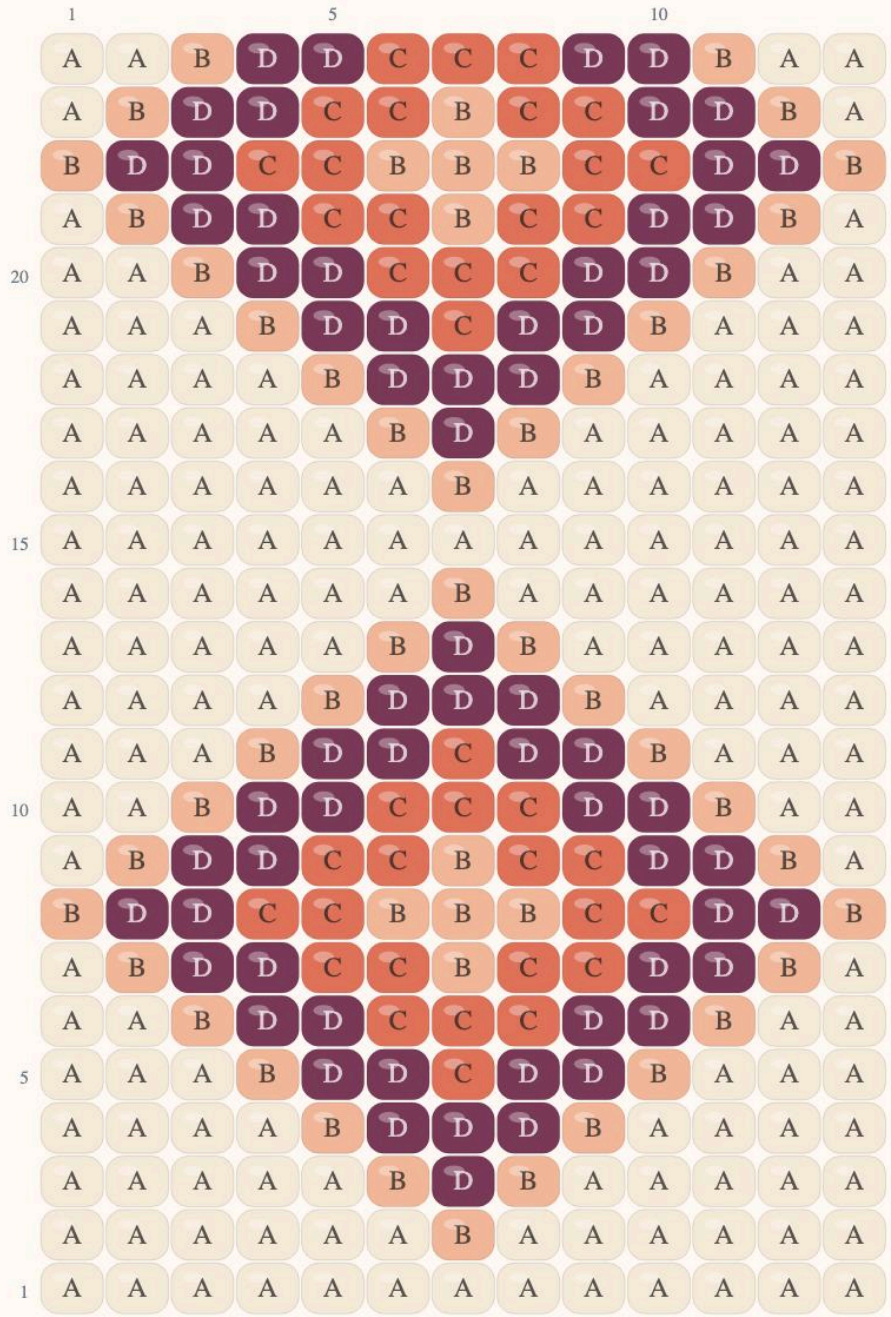

Autumn Spice

Listing ranges are examples of what similar handmade pieces are listed for, not a promise of sales. Use the Price Calculator bonus for your own numbers.

4. Sunset Diamonds Bracelet

Sunset Coral palette · Loom · 13 × 24 beads (one repeat)

STITCH	CHART SIZE	TIME (APPROX.)	TYPICAL LISTING RANGE
Loom	13 × 24 beads	6.3–9.1 h	$18–$38

	Color	Count
	A · Cream	158 beads
	B · Peach	51 beads
	C · Coral	39 beads
	D · Plum	64 beads

Total: Repeat the chart 5× for a 7-in. bracelet (≈112 rows, 1456 beads).

Weave on a bead loom: row 1 at the bott work upward. Every row is one pass of beads.

Swap colors freely: keep the same dark/light order and the pattern holds.
